Aleph inaugurates an intense autumn with the fairs SGIA of Las Vegas and Viscom of Milan, two highly anticipated concomitant occasions to present the innovations developed this year for LaForte technology. The range of digital printers is constantly expanding, in step with the conquest of new markets across the border, and it is characterized by unique features that set new printing trends for the graphics industry.

The focus is on the LaForte 200 with a print light of up to 340cm, an industrial printer for large format sublimation and the LaForte 400 Blue Back for the signage world with new graphic pigment inks that guarantee long lasting colors intended for important workloads.

The exclusive technology with rotary belt with air vacuum system allows the use of different types of papers such as transfer, blue back and melamine, offers greater stability and therefore a qualitatively unexceptionable yield. Moreover, not requiring the use of glues or solvents, it allows greater safety for the operator and, not least, greater respect for the environment, while ensuring a print speed of up to 900 sqm.

The flexibility of LaForte is very well established by the possibility of varying the configuration of the printer over time depending on the actual loads and uses: it is possible to increase the number of printheads and modify the software and the mechanical elements on the basis of production needs and therefore on the basis of the expansion of the business.
